OPA-D5-W50 operation terminal for TLR-D5

Features

- Temperature control for 2 and 4-pipe fan coil systems.
- Automatic fan control for three stage fans.
- Control for heating, cooling and fan only operation
- Cost saving option with economy functionality and set point limitation
- Password protected programmable user and control parameters
- External sensor or open contact for remote control, external heat cool change or auto-changeover on supply temperature with selectable activation limits
 - One terminal may control up to 8 base units in master-slave mode

- Clock and time schedule functions with 48 h power backup
- Blue backlight for LCD
- Infrared remote controller option:
- With special features for boost and delayed switching on or off

Ordering

A working controller consists of one operation terminal and at least one base unit.

Item name	Item code	Function	Туре	Key-data

Selection of valve actuators, fans and sensors

Temperature sensors: Use only our approved NTC sensors to achieve maximum accuracy.

Binary auxiliary devices: E.g. fans and on/off valves. Do not directly connect devices that exceed 250 VAC, 10(6) A.

Configuration of external input

The external input may be configured as external temperature control input or as binary input. The external temperature input can replace the internal sensor as control input or serve as input for the auto-changeover function. The binary input may be used to toggle comfort and economy modes or comfort and off modes. This may be used together with key card switches for hotels or motion detectors for offices.

Installation terminal

- Install the mounting plate to the electrical connection box. Make sure that the nipple with the front holding screw is facing to the ground. Make sure the screw heads do not stand out more than 5 mm of the surface of the mounting plate.
- Connect the wires of the terminals to the communication wires according wiring diagram
- Slide the two latches located on the top of the front part into the hooks of the mounting plate.
- Lower the front part until located flat on the wall and the mounting plate is not visible anymore. Make sure the connection cable does not get into the way.
- Tighten the front holding screw to secure the front part to the mounting plate.

Connection base to terminal

- Max. distance: 200 m (565 ft.)
- Normal twisted pair copper wires maybe used for wiring in an EMC-save environment. In an impaired EMC environment use only shielded cables. The operating voltage must comply with the requirements for safety extra-low voltage (SELV) as per EN 60730.
- 1 terminal may drive up to 8 base units. See wiring for parallel connections. Total wire distance should not exceed 200 m.
- Conductor resistance will influence external temperature reading. 450 Ω will result in an increase of 1 °C (2 °F). Compensate using UP-08 if external temperature is used to control unit.

Technical specification

Power failure

All the parameters and set points are memorized and don't need to be reentered. The clock will need to be reset.

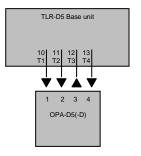

Error messages

Frr1 Error temperature sensor. The internal temperature sensor may be damaged or not present.

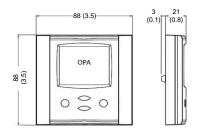

Err2: External input for heat / cool auto-change-over missing or damaged.

Frost protection is active

Wiring diagram

Dimensions

Configuration parameters for firmware version 2.5 –W50

The TLR-D5 can be adapted to wide variety of fan coil applications. The adaptation is done with parameters. The parameters can be changed on the unit without the need of additional equipment.

Identifying the firmware version

The parameters and functionality of controller depend on its firmware revision. It is therefore important to use a matching product version and parameter set. The firmware version is shown on the large LCD digits when pressing UP and DOWN buttons for more than 3 seconds simultaneously.

Changing parameters

The parameters may only be accessed by entering a code. There are two levels of parameters: User operation parameters for access control settings and expert parameters for control functions and unit setup The codes for user levels and expert levels are different. Only control experts should be given the control parameter code.

The parameters can be changed as follows:

- Press UP and DOWN button simultaneously for three seconds. The display shows the software version in the large digits and the software revision in the small digits.
- Pressing the OPTION button will indicate CODE on the small digits and 000 on the large
- The code for accessing the user parameters is 009 Select this using UP or DOWN buttons.
- Press OPTION button after selecting the correct code.
- Once logged in, the parameter is displayed immediately.
- Select the parameters with the UP/DOWN buttons. Change a parameter by pressing the OPTION button. The MIN and MAX symbols show up and indicate that the parameter may be modified now. Use UP or DOWN buttons to adjust the value.
- After you are done, press OPTION or POWER in order to return to the parameter selection
- Press the POWER button again so as to leave the menu. The unit will return to normal operation if no button is pressed for more than 5 minutes.

Parameter	Description	Range	Standard
FC 00	Minimum set point limit in heating mode	-4060 °C (160 °F)	19 °C
FC 01	Maximum set point limit in heating mode	-4060 °C (160 °F)	23 °C
FC 02	Minimum set point limit in cooling mode	-4060 °C (160 °F)	21 °C
FC 03	Maximum set point limit in cooling mode	-4060 °C (160 °F)	25 °C
ntrol Loop P	arameters		
FC 04	Economy (unoccupied) mode temperature shift: The comfort (occupied) set point is shifted by the value set with parameter. If heating is active the comfort set point will be decreased, if cooling is active, the set point will be increased. (Enable with UP06.)	0100 °C (200 °F)	2.0 °C (4 °F
FC 05	Switching span heating	0100 °C (200 °F)	0.9 °C (1.8 °
FC 06	Switching span cooling	0100 °C (200 °F)	0.7 °C (1.4 °
FC 07	Switching hysteresis is the difference between switching on and switching off. A small hysteresis will increase the number of switching cycles and thus the wear on fan and relays contacts.	0100 °C (200 °F)	0.5 °C (1 °F
FC 08	Mold protection: OFF = disabled, ON = enabled In mold protection, the fan keeps running independent of temperature as long as the unit is switched on.	ON, OFF	OFF
FC 09	Delay OFF (minimum running time)	0255 s	10 s
FC 10	Delay ON (minimum stopping time)	0255 s	10 s
FC 11	Control option: 0 = Cooling only 1 = Heating only 2 = 2-pipe system	04	3

FC 12

Output Parameters						
FC 14	Output setting, binary or 3-point: OFF = binary (DO4 Heating, DO5 Cooling) ON = 3-point output (DO4 OPEN, DO5 CLOSE)	ON, OFF	OFF			
FC 15	Reversing valve in binary mode 0 = no reversing valve (DO4 Heating, DO5 Cooling) 1 = reversing valve while heating (DO4 R. Valve, DO5 comp.) 2 = reversing valve while cooling (DO4 Comp.) DO5 R. valve)	02	0			
FC 16	Running time in 3-point mode	0255 s	90 s			

4 = cooling with fan support, heating without fan support

The dead zone span lies between the heating and the cooling set point. The output is off while the temperature is within the

dead zone span. A negative dead zone is not possible. Heat/cool changeover delay (if set to FC11 = ON): A demand to switch between heating and cooling must persist for the length of time set with this parameter before the controller switches. Prevents activation of a sequence during a short-term change in temperature in order to protect equipment

3-point floating:

For floating point outputs the running time of the actuator used needs to be specified with FC16. Running time is defined as the time required for the actuator to run from fully open to fully closed and vice versa.

Actuators with a fixed running time are recommended. Once fully open or fully closed the running time for the actuator is extended for a full run-time cycle. This will allow the actuator position to be synchronized in case it has been moved during off time or an actuator with variable running time was used.

Input parameters

Parameter	Description	Range	Standard
FC 17	External input: 0 = No external input 1 = External temperature sensor 2 = Occupation sensor - comfort / economy 3 = Occupation sensor - comfort / off 4 = Heat / cool change by open contact.
